

HTML Scenario & Analogy-Based Assignment

Lists • Tables • Text • Formatting • Links • Images

Level: Advanced Beginner / Intermediate

Concept Focus: Combine previously learned HTML elements with ordered, unordered and description lists and tables to solve realistic problems.

What Students Are Expected to Know

- Text and headings: <h1>–<h6>, <p>,
, <hr>
- Formatting: , , <i>, , <mark>, <u>, <pre>, <code>, <blockquote>, <sub>, <sup>
- Links and images: <a>, and taught attributes
- Lists: , , <dl> and their taught attributes
- Tables: table, rows, headers, data cells, caption and table-related attributes taught in class

Submission Guidelines

Inside your main HTML folder, create a folder named List_and_Table_Elements. Keep all five solutions directly inside this folder using exactly these filenames:

```
HTML/  
  List_and_Table_Elements/  
    problem-01.html  
    problem-02.html  
    problem-03.html  
    problem-04.html  
    problem-05.html
```

Do not create separate folders for each problem.

Problem 1: University Admission Handbook

Real-Life Analogy: A university admission office has a printed handbook containing sections, sequential admission steps, required documents, definitions of admission terms, and a fee chart. Convert it into a well-structured HTML page.

Problem Statement & Requirements

1. Create a page titled University Admission Handbook with the university name as `<h1>`.
2. Create sections for Admission Overview, Eligibility, Application Process, Required Documents, Important Terms, Fee Structure and Contact.
3. Use `<ol>` for the admission process because the steps must be followed in sequence.
4. Use `<ul>` for required documents because their order does not matter.
5. Use `<dl>` for terms such as Eligibility, Merit List, Counselling, Scholarship and Registration.
6. Create a fee table with Program/Course, Duration, Tuition Fee, Examination Fee and Total Fee.
7. Include at least six fee rows and a meaningful table caption.
8. Use table headers correctly.
9. Use `<strong>` for mandatory requirements and `<mark>` for the application deadline.
10. Add an official admission link and at least one useful external reference.
11. Add a relevant university/admission image with meaningful alt text.
12. Include an admission-office message using `<blockquote>`.
13. Use `<hr>` to separate major sections.

Best-Level Challenge: Students must correctly distinguish sequence, collection and definition: ordered list for steps, unordered list for documents, description list for terms, and table for structured fee data.

Problem 2: Restaurant Digital Menu & Pricing Board

Real-Life Analogy: A restaurant owner has a physical menu containing categories, dishes, descriptions, special offers and prices. Build a digital HTML version that remains understandable without CSS.

Problem Statement & Requirements

1. Create a restaurant page with restaurant name, introduction paragraph and a relevant restaurant image.
2. Create sections for Starters, Main Course, Desserts and Beverages.
3. Use `<ul>` for dishes within categories.
4. Use `<ol>` for a genuinely sequential Chef's Recommended Dining Experience.
5. Use `<dl>` for terms such as Vegan, Chef's Special, Gluten-Free, Bestseller and Combo.
6. Create a detailed pricing table with Item, Category, Size, Price and Availability.
7. Include at least eight food items.
8. Use `rowspan` or `colspan` where it genuinely improves the table structure, if taught.
9. Add a descriptive table caption.
10. Use `<strong>` for signature dishes and `<mark>` for special offers.
11. Add at least three food images; make at least one image clickable.
12. Add location/contact and reservation links.
13. Use `<blockquote>` for a short customer quote.

Best-Level Challenge: The challenge is deciding whether information is a category/list, a definition, or structured pricing data. Do not use tables simply for layout.

Problem 3: College Timetable & Academic Portal

Real-Life Analogy: A college department currently displays its weekly timetable and academic information on a notice board. Students need an HTML version containing the timetable and supporting information.

Problem Statement & Requirements

1. Create a page titled Department Academic Portal with department name as `<h1>`.
2. Create sections for Introduction, Weekly Timetable, Subjects, Faculty Information, Academic Rules and Contact.
3. Create a timetable with Day, 1st Period, 2nd Period, 3rd Period, Lunch, 4th Period and 5th Period.
4. Include Monday through Saturday.
5. Use rowspan/colspan for Lunch, common sessions, or another logically merged cell if taught.
6. Add a table caption and proper headers.
7. Create an `<ol>` for the sequence students follow before a practical class.
8. Create a `<ul>` for classroom rules.
9. Create a `<dl>` defining Lecture, Lab, Tutorial, Internal Assessment and Practical.
10. Create a second table containing Subject Code, Subject Name, Faculty and Credits.
11. Use `<strong>` for mandatory rules and `<mark>` for an important academic notice.
12. Add a department image and relevant website link.
13. Include a faculty/department message using `<blockquote>`.

Best-Level Challenge: The main difficulty is modeling real timetable data. Students must understand rows, columns and merged cells rather than creating a random grid.

Problem 4: E-Commerce Product Comparison Page

Real-Life Analogy: A technology shopping website wants a comparison page for students choosing between laptops. The page must contain product information, definitions, buying guidance and structured comparison data.

Problem Statement & Requirements

1. Create a page titled Laptop Comparison Guide with a meaningful introduction.
2. Add at least three laptop/product images with descriptive alt text.
3. Create a `<ul>` for general buying factors such as processor, RAM, storage, display, battery and warranty.
4. Create an `<ol>` for a step-by-step How to Choose Your Laptop guide.
5. Create a `<dl>` explaining RAM, SSD, CPU, GPU, Refresh Rate and Battery Capacity.
6. Create a comparison table with at least four products and at least eight comparison fields.
7. Include Product, Processor, RAM, Storage, Display, Battery, Price, Warranty and Best For.
8. Use proper table headers and a descriptive caption.
9. Use `<strong>` for the recommended product and `<mark>` for an important offer.
10. Add View Product/Buy Now links for every product.
11. Make each product image clickable and connect it to a relevant detail page.
12. Use `<blockquote>` for an expert recommendation.
13. Include a technical block using `<pre>` and `<code>`.

Best-Level Challenge: The challenge is combining three different list purposes with a complex comparison table while keeping every product comparable using the same attributes.

Problem 5: FINAL CHALLENGE — College Fest Management Portal

Real-Life Analogy: A college is organizing a three-day annual fest. The organizing committee needs an HTML-only portal for students containing schedules, competitions, rules, registration, prizes and contacts.

Problem Statement & Requirements

1. Create a page titled Annual College Fest 2026 with an appropriate event image/banner.
2. Create sections for Fest Introduction, Event Schedule, Competitions, Registration Process, Rules, Awards, Sponsors/Partners and Contact.
3. Create a three-day schedule table with Date, Time, Event, Venue, Category and Coordinator.
4. Use rowspan/colspan where logically appropriate for repeated dates, breaks or common sessions, if taught.
5. Create an describing registration step by step.
6. Create a for general fest rules.
7. Use nested lists where appropriate, such as competition categories containing events.
8. Create a <dl> defining Open Event, Team Event, Individual Event, Registration, Coordinator and Final Round.
9. Create a prize table with Event, Participation Type, Eligibility, Registration Fee, First Prize and Second Prize.
10. Create a coordinator/contact table with Name, Responsibility, Contact and Event Category.
11. Use for mandatory rules and <mark> for the registration deadline.
12. Add at least two relevant images and make at least one image clickable.
13. Add registration, official fest and relevant social/official links using taught anchor attributes.
14. Include an organizer message using <blockquote>.
15. Include a <pre><code> block showing a sample registration/reference format.
16. Use <hr> between major sections.
17. Use paragraphs for normal prose, lists for collections/sequences/definitions, and tables only for structured multi-record data.

Best-Level Challenge: This is the hardest problem. Students must model a complete real-world event system and make correct decisions about when information belongs in a paragraph, ordered list, unordered list, description list, or table.

Expected File Structure

```
HTML/  
  List_and_Table_Elements/  
    problem-01.html  
    problem-02.html  
    problem-03.html  
    problem-04.html  
    problem-05.html
```

Important Quality Expectations

- Do not use a table merely to arrange normal text; tables represent structured data.
- Use when order matters and when order does not matter.
- Use <dl> for genuine term-and-description relationships.
- Use proper table headers and keep columns consistent.
- Use rowspan/colspan only when cells logically span rows or columns.
- Use images and links purposefully with meaningful alternative text.
- Maintain clean indentation and logical HTML hierarchy.
- Do not use CSS or JavaScript; focus on HTML structure and semantics.
