

HTML_Semantic_Element

Semantic HTML • Scenario-Based Lab Assignment

Deadline	Saturday, 11:59 PM
Level	Advanced / Practical HTML
Coverage	Semantic HTML + all previously taught HTML concepts

Objective

Build five realistic web pages using semantic HTML5. Every problem must combine today's semantic-element concepts with your previously taught topics: text and formatting, links and images, lists and tables, and forms with input/select/textarea. Focus on **meaningful structure, accessibility-friendly markup, correct element choice, and clean HTML**.

Mandatory Coverage in Every Problem

- **Semantic:** Use suitable elements such as header, nav, main, section, article, aside, footer, figure and figcaption where their meaning is justified.
- **Text & formatting:** headings, paragraphs, hr/br and suitable formatting/meaning elements such as strong, em, mark, u, code, pre, blockquote, sub, sup, etc.
- **Links & images:** meaningful links, relevant images, useful alt text, and image links where requested.
- **Lists & tables:** ul/ol/dl for collections, sequences and definitions; tables only for genuine structured data with captions and proper headers.
- **Forms:** realistic forms using labels, suitable input types, select/options, textarea and relevant attributes taught in class.

Rules

- No CSS or JavaScript is required. Concentrate on HTML structure and semantics.
- Do not use div/span when an appropriate semantic element can express the meaning.
- Do not use tables for page layout.
- Do not use lists merely to create visual spacing/layout.
- Use realistic content instead of filling every area with generic placeholder text.

Problem 01 — University Admissions & Student Portal

A university needs a public admissions portal where prospective students can explore programs, eligibility, campus facilities, important dates and the application process.

Requirements

Semantic structure: Create header and nav for university identity/navigation, main for the page's primary content, sections for major topics, article for an independent admission announcement/news item, aside for application-help/related information, and footer for contact/legal information. Use figure/figcaption for suitable campus/program imagery.

Text & formatting: Include university introduction, program descriptions, eligibility, important notice and a student/alumni blockquote. Demonstrate at least 6 meaningful text/formatting elements from previous classes. Use code/pre only where a technical/application reference makes sense.

Links & images: Add links such as Home, Programs, Admissions, Scholarships and Contact plus relevant external/reference links. Include at least 4 images with meaningful alt text; at least 2 must be clickable.

Lists & tables: Create a ul of facilities/benefits, an ol of application steps, and a dl defining terms such as Eligibility, Merit List, Scholarship and Application Fee. Create an admission table with at least 6 rows and columns such as Program, Duration, Eligibility, Mode, Intake and Fee, including caption and proper headers.

Form: Create an Apply Now form containing name, email, mobile, date of birth, program select, study-mode options, address textarea, declaration checkbox and submit/reset controls. Use labels, suitable input types and appropriate validation-related attributes.

Quality bar: The page should read like a real university portal. Group content according to meaning rather than putting everything into generic containers.

Submission: Save this task as **problem-01.html**. Keep the HTML properly indented and meaningful.

Problem 02 — Corporate Careers & Recruitment Hub

A growing technology company wants a careers portal where candidates can explore jobs, understand benefits and hiring stages, and submit an application.

Requirements

Semantic structure: Use header, nav, main and footer. Create sections for Careers, Open Positions, Culture/Benefits, Hiring Process and Application. Use article for individual job postings and aside for recruiter tips/related resources.

Text & formatting: Write a company introduction, employee-value statement, job descriptions, hiring notes and an employee blockquote. Demonstrate at least 6 previously taught text/formatting elements. Use code/pre for a meaningful technical skill-stack example if appropriate.

Links & images: Add links for Company, Careers, Engineering, Benefits, Privacy and Contact. Include at least 5 workplace/team images; at least 2 must be clickable.

Lists & tables: Use a ul for benefits, ol for hiring stages, and dl for Screening, Technical Round, HR Round and Offer. Create a job table with at least 7 positions and columns such as Role, Department, Location, Experience, Type and Closing Date.

Form: Create a job application form with name, email, phone, position select, experience, employment type/availability, resume upload if taught, portfolio URL, preferred location, skills, cover-letter textarea, consent checkbox and submit/reset.

Quality bar: Represent genuinely independent jobs as articles and keep recruiter guidance separate as supporting content.

Submission: Save this task as **problem-02.html**. Keep the HTML properly indented and meaningful.

Problem 03 — Healthcare Clinic Information & Appointment Portal

A multi-specialty clinic needs an information and appointment page where visitors can understand services, schedules and how to request an appointment.

Requirements

Semantic structure: Use header, nav, main, footer and meaningful sections. Use article for an individual service/doctor profile, aside for patient instructions/supporting information, and figure/figcaption for facility/service imagery.

Text & formatting: Include clinic introduction, services, operating information, patient notes and a disclaimer. Add a suitable blockquote and at least 6 meaningful text/formatting elements. Use sub/sup only where genuinely meaningful.

Links & images: Provide links for departments, patient resources, contact/location and appointment information. Include at least 4 relevant images with useful alt text; at least 2 should be clickable.

Lists & tables: Create a ul of services, ol of appointment steps, and dl defining Consultation, Follow-up, OPD and Appointment. Create a doctor/service schedule table with at least 6 rows and columns such as Specialist, Department, Days, Time and Consultation Type.

Form: Create an appointment request form with patient name, email, mobile, date, preferred time, department select, doctor select, consultation type, age, reason/symptoms textarea, consent checkbox and submit/reset controls.

Quality bar: Keep the page informational rather than diagnostic. Make schedules, instructions and the form easy to locate through semantic structure.

Submission: Save this task as **problem-03.html**. Keep the HTML properly indented and meaningful.

Problem 04 — E-Commerce Product & Customer Support Page

An electronics retailer wants a flagship laptop product page where customers can understand the product, compare configurations, read support information and submit a pre-sales question.

Requirements

Semantic structure: Use header, nav, main, section, article and footer. Use article for the primary product information, aside for related products/support/warranty information, and figure/figcaption for product imagery.

Text & formatting: Create product title, overview, features, technical notes, warranty information and a customer quote. Demonstrate at least 6 previous text/formatting elements. Use code/pre for a meaningful technical example and sub/sup where appropriate.

Links & images: Include links for Home, Laptops, Accessories, Warranty, Support, Shipping, Returns and Manufacturer. Add at least 5 product/support images; at least 3 must be clickable.

Lists & tables: Create a ul of key features, ol for purchase/setup steps, and dl defining RAM, SSD, Refresh Rate and Warranty. Create a comparison table with at least 4 configurations and columns for Processor, RAM, Storage, Display, Battery, Price and Warranty.

Form: Create a product-information form with name, email, phone, configuration select, preferred contact method, subject, question textarea, optional callback date/time, consent checkbox and submit/reset.

Quality bar: The product article, supporting information and comparison data must have clearly different semantic purposes.

Submission: Save this task as **problem-04.html**. Keep the HTML properly indented and meaningful.

Problem 05 — National Career & Education Fair Portal

A large career and education fair is being organized for students and job seekers. Build a complete portal containing event information, participating organizations, schedules, preparation guidance, terminology/FAQ-style information and registration.

Requirements

Semantic structure: Use header, nav, main and footer. Organize main into Event Overview, Participating Organizations, Schedule, Preparation Guide, Information/FAQs and Registration. Use article for independent organization/event information, aside for preparation tips/notices, and figure/figcaption for event images.

Text & formatting: Write a detailed event introduction, objectives, participant guidance and organizer blockquote. Demonstrate at least 8 meaningful text/formatting elements from previous classes. Include code/pre for a suitable registration/reference format and sub/sup where meaningful.

Links & images: Provide useful links for Register, Organizations, Venue, Contact, Help, Privacy and official/external resources. Include at least 6 relevant images; at least 3 must be clickable. Use meaningful alt text.

Lists & tables: Create a ul for preparation tips, ol for the attendee journey, and dl for Career Fair, Internship, Placement, Scholarship and Apprenticeship. Create a participant table with at least 8 organizations and columns such as Organization, Sector, Opportunity Type, Eligibility, Location and Official Website/Reference. Create a separate schedule table with at least 8 sessions and columns Date, Time, Session, Venue and Coordinator. Add captions and proper headers.

Form: Create a complete registration form with name, email, mobile, date of birth/age, qualification select, specialization, attendee type, preferred career sector, location, experience, resume upload if taught, session preference, questions textarea, privacy/consent checkbox and submit/reset.

Quality bar: This is the final challenge: make it feel like a real event portal and demonstrate that semantic elements are chosen for meaning, while every previously taught concept is integrated naturally.

Submission: Save this task as **problem-05.html**. Keep the HTML properly indented and meaningful.

Final Quality Checklist

- Semantic elements are selected because of meaning, not appearance.
- Every page has a logical header, navigation, main content and footer.
- Sections/articles/aside are used only where their semantic purpose is justified.
- Previous text, formatting, link, image, list, table and form concepts are all demonstrated.
- Images have meaningful alt text and links have meaningful destinations/text.
- Tables contain genuine structured data with captions and proper headers.
- Forms contain labels, suitable controls, meaningful names and appropriate attributes.
- HTML remains logically understandable without CSS or JavaScript.
- Code is properly nested, indented and free from unnecessary generic containers.
- Files are named problem-01.html through problem-05.html.
